

A Consensus Statement

Zero Waste solutions for Australia - not waste incineration.

We the undersigned, demand an immediate end to Government subsidies and finance for all waste to energy incinerator proposals in Australia and urgent investment in sustainable Zero Waste models of waste management with the full engagement and inclusion of the community.

We stand in solidarity with communities across Australia facing the threat of multiple waste incineration projects. These technologies impose significant pollution burdens and associated health and environmental impacts that extend well beyond the facility fence-line. Waste to energy incinerators destroy finite resources and leave a legacy of dangerous air emissions and toxic ash. Establishing waste to energy incinerators is a step in the wrong direction for positive action on climate change, clean renewable energy, sustainable waste management and a circular economy. We are calling for the adoption of safe, sustainable and proven Zero Waste management models¹ in all Australian states and Territories.

Australians have rejected this industry for decades, but the incinerator lobby have now targeted politicians to seek legislative support and subsidies while bypassing public opposition. **This statement reaffirms the resolve of Australians to stand firm and reject this polluting industry.**

We acknowledge the global consensus that carbon pollution is driving dangerous climate change. The global and existential threat that climate change represents is also an opportunity to make change towards ecologically sustainable systems of food and materials production, global peace, security and unity. Zero Waste Solutions represents real action on climate change.

We call for an immediate end to renewable energy subsidies for waste incineration. Burning waste for energy contributes more greenhouse gases (GHGs)² and toxic air pollutants³ per unit of energy than coal, oil or gas. Waste incinerators rely on the high calorific value of plastic – a fossil fuel based material that contains numerous toxic substances that contribute to incinerator air pollution. Waste to energy incinerators do not provide clean renewable energy and therefore should not be entitled to renewable energy subsidies, grants or funds. These funds should be directed to real renewable energy projects.

We expose the significant global pollution burden that waste incineration creates.

Waste incineration emits a range of toxic and hazardous air pollutants⁴ that include mercury, nanoparticles and Persistent Organic Pollutants (POPs) such as dioxins and furans (PCDD/DF), hexachlorobenzene (HCB), Polychlorinated Biphenyls (PCBs) and brominated persistent organic pollutants which are subject to the International Stockholm Convention on POPs. Australia is a signatory to this convention and are therefore obliged to reduce and where possible, eliminate all forms POPs⁵. These POPs are persistent and toxic in the environment, bio-accumulate up the food chain and can travel vast distances across borders ultimately accumulating in the polar ice caps posing disproportionate adverse impacts on indigenous communities in these regions.⁶ Approving incinerators will unnecessarily increase Australia's output of dioxins and other POPs thereby undermining the objectives of the convention.

We expose the disproportionate impact waste incinerators impose on host communities. It is the most vulnerable in the community, such as children, that are most at risk from the toxic air pollutants emitted by waste incinerators and the stockpiles of toxic ash they generate. These pollutants impact health at low levels of exposure. Host communities carry the disproportionate burdens of this industrial pollution through contaminated land and air leaving residues in their environment that can contaminate the food chain, water and other life support systems they depend upon⁷.

We recognise that waste incinerators cost jobs.

Independent research⁸ has reported that zero waste management systems that use recycling, re-use, composting and anaerobic digestion generate many more jobs than incinerators. In general terms, waste incinerators are expensive, computer controlled, and mostly automated technology that only requires a small workforce to operate. Zero Waste Solutions based around recycling, re-use and composting, have a high employment opportunities and flow-on effects throughout the community and economy.

We call for investment in zero waste solutions to address impending climate threats.

Australia is at a cross roads. Decisions made today about waste management will have long term financial, ecological and human rights impacts. Burning our waste for energy entrenches an unsustainable linear economic model of raw materials extraction, production, consumption and disposal, wasting the finite resources contained in our waste streams that belong to future generations. While the EU moves to end subsidies for waste incineration and legislate for Zero Waste Solutions with strong policies to discourage the establishment of new incinerators and decommission old incinerators⁹, Australia has a unique opportunity to learn from the mistakes of other comparable western countries without repeating them.
